

The Honey Colony

Our Honey Producer – Honey for Life

Honey for Life – Australia

Their story - Honey For Life is committed to producing honey that is raw, organic and served in its purest form, with as little human interaction as possible. The way nature intended.

With some of the most beautiful and pristine forests in the world in Western Australia, they are fortunate to produce some of Australia's most sought-after honeys, including Jarrah, Karri and Red Gum.

In 2019, Honey for Life purchased one of Western Australia's leading commercial beekeeping operations, Davies Apiaries, established some 40 years ago. With a state-of-the-art extraction facility and 1,200 hives, they have since worked hard to expand this operation.

Honey for Life – Australia

The Future - Since late 2016, Honey for Life has been working hard to establish Manuka honey plantations on reclaimed farmland throughout the southwestern region of Western Australia. They are increasing their acreage year after year and aim to become one of Australia's leading suppliers of manuka honey and specialty monofloral honey in the near future.

Honey for Life produces honey with a "Total Activity". Total Activity is a big driving force for the company, which defines their approach to produce organic and delicious honey.

All their honey is tested to determine the "Total Activity". Total Activity refers to the antimicrobial quality of the honey, i.e. its ability to fight bacteria. The higher the Total Activity, the stronger the antibacterial properties.

Where is their honey harvested?

The Western Australian forest regions contain a vast majority of the flora and fauna of the WA regions. A continuous chain of national parks and nature reserves contain majestic Karri trees, Jarrah forests and Red Gum trees. These forest regions are found only in the southwest corner of Western Australia which has the highest rainfall and coolest temperatures in the state. An intrinsically special environment allows the growth and cultivation of some of the best honey's known to man.

Where is their honey harvested?

the honey colony

Wildflower Honey – Harvested in the area marked red on the map.

Jarrah Honey – Harvested in the area marked white on the map.

Karri Honey – Harvested in the area marked yellow on the map.

Red Gum Honey – Harvested in the area marked white on the map.

Wandoo Honey – Harvested in the area marked white on the map.

Desert Mallee Honey – Harvested in the area marked blue on the map.

Southern Yate (currently not available) – Harvested in the area marked black on the map.

How is it harvested?

Harvested from various locations across Western Australia. These unique ecosystems are free from contaminants such as pesticides, fertilizers and pollution.

Our beekeepers take the utmost care during the harvest months to ensure the safety and well-being of our honeybees.

Their honey is cold extracted (they do not heat treat our honey) and not exposed to ultrafiltration which means all the active properties and beneficial nutrients stay intact.

What makes our honey so special?

Why is our honey harvested cold?

Ordinary honey is heat treated. During such treatment important antioxidants are lost. Our honey is not subjected to heat treatment. This means that it retains all essential antibacterial functions.

Rare

Their honey is rare. It comes from a single ancient forest in Australia.

Pure

Their honey is pure. It is independently certified by government and external laboratories to ensure its purity.

Active

Using the latest techniques for measuring honey activity, their honey is tested by third-party laboratories and approved by accredited bodies.
